Pick Tasks for Outbound Orders

DATE: ***01/25/2010***

Retrieval pick tasks are for outbound shipments for incident/other issues, and are generated automatically when a shipment is created.

To pick the item from the pick location

1 Under **Menu**, double-tap **Retrieval**.

2 Scan the **Start Location**.

The Start Location identifies where you are in the cache so that the nearest putaway tasks can be suggested first.

3 Scan the **pick location**, and then tap Go

4 Scan the **Item ID**, type the **quantity**, and then tap Go

If all pick tasks have been completed, the next suggested deposit task displays on your screen.

5 Once all pick tasks have been completed, scan the **deposit location**, and then tap Deposit All
